# Natural Language Processing (NLP)

# Word representations

**How can we represent the *meaning* of words?**

# Word representations

**How can we represent the *meaning* of words?**

So we can ask:

- How similar is *cat* to *dog*, or *Paris* to *London*?
- How similar is *document A* to *document B*?

# Word representations

**How can we represent the *meaning* of words?**

So we can ask:

- How similar is *cat* to *dog*, or *Paris* to *London*?
- How similar is *document A* to *document B*?

And use such representations for:

- various NLP tasks: translation, classification, etc.
- studying linguistic questions

# Dictionaries

## bank noun (2)

### Definition of *bank* (Entry 3 of 5)

- 1 **a** : an establishment for the custody, loan, exchange, or issue of money, for the extension of credit, and for facilitating the transmission of funds  
*//* paychecks automatically deposited into the *bank*  
*//* went to the *bank* to make a withdrawal  
*//* open a *bank* account
- b** *obsolete* : the table, counter, or place of business of a money changer
- 2 : a person conducting a gambling house or game  
*specifically* : DEALER
- 3 : a supply of something held in reserve: such as
  - a** *in games* : the fund of supplies (such as money, chips, or pieces) held by the banker (see [BANKER](#) entry 1 sense 2) or dealer
  - b** *in games* : a fund of pieces (such as dominoes) from which the players draw  
*//* select another domino from the *bank*
- 4 : a place where something is held available  
*//* memory *banks*  
*especially* : a depot for the collection and storage of a biological product  
*//* a blood *bank*

# WordNet

## bank Noun

- **bank** (sloping land (especially the slope beside a body of water)) “*they pulled the canoe up on the bank*”; “*he sat on the bank of the river and watched the currents*”
- depository financial institution, **bank**, banking concern, banking company (a financial institution that accepts deposits and channels the money into lending activities) “*he cashed a check at the bank*”; “*that bank holds the mortgage on my home*”
- ...

## Verb

- **bank** (tip laterally) “*the pilot had to bank the aircraft*”
- **bank** (do business with a bank or keep an account at a bank) “*Where do you bank in this town?*”
- ...

<https://wordnet.princeton.edu>

# WordNet

**recap!**

## Vector representations

$$\mathbf{a} = [5, 5]$$

$$\mathbf{b} = [2, 1]$$

$\mathbf{a}$  is a *two-dimensional* vector

Figure: Points in a two dimensional vector space

**recap!**

# Vector representations

$$a = [5, 5, 2]$$

$$b = [2, 1, 0]$$

$a$  is a *three-dimensional* vector

**Figure:** Points in a three dimensional vector space

**recap!**

# Vector representations

$$a = [5, 5, 2]$$

$$b = [2, 1, 0]$$

$a$  is a *three-dimensional* vector

Key idea in NLP:

Can we **represent words as vectors**  
(i.e. points in a vector space?)

Figure: Points in a three dimensional vector space

# Word as vectors

**Key idea:** Can we represent words as vectors?

The vector representations should:

- capture semantics
  - similar words should be close to each other in the vector space
  - relation between two vectors should reflect the relationship between the two words
- be efficient (vectors with fewer dimensions are easier to work with)
- be interpretable

# Word as vectors

**Key idea:** Can we represent words as vectors?

The vector representations should:

- capture semantics
  - similar words should be close to each other in the vector space
  - relation between two vectors should reflect the relationship between the two words
- be efficient (vectors with fewer dimensions are easier to work with)
- be interpretable

How similar are *smart* and *intelligent*? (not similar 0–10 very similar):  
How similar are *easy* and *big* (not similar 0–10 very similar):

# Word as vectors

**Key idea:** Can we represent words as vectors?

The vector representations should:

- capture semantics
  - similar words should be close to each other in the vector space
  - relation between two vectors should reflect the relationship between the two words
- be efficient (vectors with fewer dimensions are easier to work with)
- be interpretable

How similar are *smart* and *intelligent*? (not similar 0–10 very similar): **9.2**

How similar are *easy* and *big* (not similar 0–10 very similar): **1.12**

(*SimLex-999 dataset*)

# How are they used?

## How are they used?

*In neural networks (text classification, sequence tagging, etc..)*

cat	0.52	0.48	-0.01	...	0.28
dog	0.32	0.42	-0.09	...	0.78

*As research objects*

# Properties

We can use cosine similarity to find similar words in the vector space.

- **dog:** *dogs, cat, man, cow, horse*
- **car:** *driver, cars, automobile, vehicle, race*
- **amsterdam:** *netherlands, rotterdam, dutch, centraal, paris*
- **chocolate:** *candy, beans, caramel, butter, liquor*

## Exercise (5 min)

- Go to <https://projector.tensorflow.org/>. The site should load 'Word2Vec 10K' vectors by default (see left panel).
- What are the 5 nearest words to 'cat'?
- What are the 5 nearest words to 'computer'?

# Words as vectors

# One hot encoding

**Map each word to a unique identifier**

e.g. *cat* (3) and *dog* (5).

→ Vector representation: all zeros, except 1 at the ID

cat	0	0	1	0	0	0	0
dog	0	0	0	0	1	0	0
car	0	0	0	0	0	0	1

# One hot encoding

**Map each word to a unique identifier**

e.g. *cat* (3) and *dog* (5).

→ Vector representation: all zeros, except 1 at the ID

cat	0	0	1	0	0	0	0
dog	0	0	0	0	1	0	0
car	0	0	0	0	0	0	1

What are limitations  
of one hot encodings?

# One hot encoding

**Map each word to a unique identifier**

e.g. *cat* (3) and *dog* (5).

→ Vector representation: all zeros, except 1 at the ID

cat	0	0	1	0	0	0	0
dog	0	0	0	0	1	0	0
car	0	0	0	0	0	0	1

Even related words  
have distinct vectors!

High number of  
dimensions

You shall know a word by  
the company it keeps  
(Firth, J. R. 1957:11)

**The distributional hypothesis:** Words that occur  
in similar contexts tend to have similar meanings

# Word vectors based on co-occurrences

**documents as context**  
**word-document matrix**

	doc <sub>1</sub>	doc <sub>2</sub>	doc <sub>3</sub>	doc <sub>4</sub>	doc <sub>5</sub>	doc <sub>6</sub>	doc <sub>7</sub>
cat	5	2	0	1	4	0	0
dog	7	3	1	0	2	0	0
car	0	0	1	3	2	1	1

# Word vectors based on co-occurrences

**documents as context**  
**word-document matrix**

	doc <sub>1</sub>	doc <sub>2</sub>	doc <sub>3</sub>	doc <sub>4</sub>	doc <sub>5</sub>	doc <sub>6</sub>	doc <sub>7</sub>
cat	5	2	0	1	4	0	0
dog	7	3	1	0	2	0	0
car	0	0	1	3	2	1	1

**neighboring words as context**  
**word-word matrix**

	cat	dog	car	bike	book	house	tree
cat	0	3	1	1	1	2	3
dog	3	0	2	1	1	3	1
car	0	0	1	3	2	1	1

# Word vectors based on co-occurrences

There are many variants:

- Context (words, documents, which window size, etc.)
- Weighting (raw frequency, etc.)

**Vectors are sparse:** Many zero entries.

Therefore: Dimensionality reduction is often used (e.g., SVD)

These methods are sometimes called **count-based** methods as they work directly on **co-occurrence** counts.

# Word embeddings

# Word embeddings

## Word embeddings:

- Vectors are short; typically 50-1024 dimensions 😊
- Vectors are dense (mostly non-zero values)
- Very effective for many NLP tasks 😊
- Individual dimensions are less interpretable 😞

# Aside: terminology

## **Distributed representations**

Dense, real-valued vectors

## **Distributional representations**

Derived from how words are used in a corpus

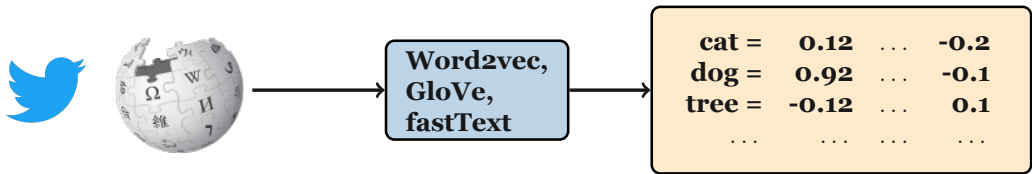

*Word2vec (and others) are distributed representations based on the distributional hypothesis.*

How do we learn word embeddings?

# Learning word embeddings

# Learning word embeddings

# Training data

How can we train a model to learn the meaning of words?  
Which data can we use for supervised learning?

# Training data

How can we train a model to learn the meaning of words?  
Which data can we use for supervised learning?

**Key idea:**

Use text itself as training data for  
the model!

A form of *self-supervision*.

# Training data

How can we train a model to learn the meaning of words?  
Which data can we use for supervised learning?

## Key idea:

Use text itself as training data for the model!

A form of *self-supervision*.

**Example:** Train a neural network to predict the next word given previous words.

A neural probabilistic language model. Bengio et al. (2003), JMLR [\[url\]](#)

Natural language processing (almost) from scratch, Collobert et al. (2011), JMLR, [\[url\]](#)

# Exercise: Word prediction task

yesterday I went to the ?

A new study has highlighted the positive ?

Which word comes next?

# Word2Vec

The domestic **cat** is a small, typically furry carnivorous mammal

$w_{-2}$   $w_{-1}$   $w_0$   $w_1$   $w_2$   $w_3$   $w_4$   $w_5$

We have **target** words (*cat*) and **context** words (here: window=5).

Remember: distributional  
hypothesis

# Word2Vec

## Two different tasks (context):

- Continuous Bag-Of-Words (CBOW)
- Skipgram

## Two training regimes

- Hierarchical softmax
- Negative sampling

# Word2Vec: skipgram overview

The domestic **cat** is a small, typically furry carnivorous mammal

word (w)	context (c)	label
cat	small	1
cat	furry	1
cat	car	0
...	...	...

# Word2Vec: skipgram overview

The domestic **cat** is a small, typically furry carnivorous mammal

word (w)	context (c)	label
cat	small	1
cat	furry	1
cat	car	0
...	...	...

## 1. Create examples

- Positive examples: Target word and neighboring context
- Negative examples: Target word and randomly sampled words from the lexicon (*negative sampling*)

- ## 2. Train a **logistic regression** model to distinguish between the positive and negative examples
- ## 3. The resulting **weights** are the embeddings!

# Word2Vec: skipgram overview

The domestic **cat** is a small, typically furry carnivorous mammal

word (w)	context (c)	label
cat	small	1
cat	furry	1
cat	car	0
...	...	...

Embedding vectors are essentially a byproduct!

## 1. Create examples

- Positive examples: Target word and neighboring context
- Negative examples: Target word and randomly sampled words from the lexicon (*negative sampling*)

2. Train a **logistic regression** model to distinguish between the positive and negative examples

3. The resulting **weights** are the embeddings!

# Word2Vec: skipgram

The domestic **cat** is a small, typically furry carnivorous mammal  
 $c1 \quad c2 \quad w \quad c3 \quad c4 \quad c5 \quad c6 \quad c7$

We have **target** words (*cat*) and **context** words (here: window=5).

The probability that  $c$  is a real context word:

$$P(+|w, c)$$

The probability that  $c$  is not a real context word:

$$P(-|w, c)$$

See also: 6.8 of Speech and Language Processing (3rd ed. draft), Dan Jurafsky and James H. Martin  
<https://web.stanford.edu/~jurafsky/slp3/>

# Word2Vec: skipgram

Intuition: A word  $c$  is likely to occur near the target if its embedding is similar to the target embedding.

$$\approx w \cdot c$$

Turn this into a probability using the sigmoid function

$$P(+|w, c) = \frac{1}{1 + e^{-w \cdot c}}$$

See also: 6.8 of Speech and Language Processing (3rd ed. draft), Dan Jurafsky and James H. Martin  
<https://web.stanford.edu/~jurafsky/slp3/>

# Word2Vec

## Words:

Each word  $w$  is represented as a  $d$ -dimensional vector.

## Contexts:

Each word  $w$  is represented as a  $d$ -dimensional vector.

All vectors are initialized with random weights.

# Word2vec: skipgram (learning)

We **start** with random embedding vectors.

# Word2vec: skipgram (learning)

We **start** with random embedding vectors.

## **During training:**

- *Maximize* the similarity between the embeddings of the target word and context words from the positive examples
- *Minimize* the similarity between the embeddings of the target word and context words from the negative examples

# Word2vec: skipgram (learning)

We **start** with random embedding vectors.

## **During training:**

- *Maximize* the similarity between the embeddings of the target word and context words from the positive examples
- *Minimize* the similarity between the embeddings of the target word and context words from the negative examples

## **After training:**

- frequent word-context pairs in data:  $w \cdot c$  high
- not word-context pairs in data:  $w \cdot c$  low

So: Words occurring in same contexts are close to each other

# Word2vec: skipgram (learning)

Figure: Figure 6.14 from Speech and Language Processing (3rd ed. draft), Dan Jurafsky and James H. Martin  
<https://web.stanford.edu/~jurafsky/slp3/>

# fastText

Limitation of word2vec: Can't handle unknown words :(

fastText is very similar to word2vec, but each word is **represented as a bag of character  $n$ -grams** (+ the word itself).  $\leq$  and  $\geq$  mark word boundaries.

Example: *where* with  $n = 3$ : <wh, whe, her, ere, re> and <where>

Representation of a word: The sum of the vector representations of its  $n$ -grams.

Enriching Word Vectors with Subword Information, Bojanowski et al., TACL 2017, [\[url\]](https://fasttext.cc/), software: <https://fasttext.cc/>

# GloVe

- First create a *global word-word co-occurrence matrix* (how frequent pairs of words occur with each other). Requires a pass through the entire corpus at the start!
- Training objective: learn word embeddings so that their dot products equals the log of the words' co-occurrence probability.

GloVe: Global Vectors for Word Representation, Pennington et al., EMNLP 2015 [\[url\]](https://nlp.stanford.edu/projects/glove/), software <https://nlp.stanford.edu/projects/glove/>

# Pre-trained embeddings

- I want to build a system to solve a task (e.g. sentiment analysis)
  - Use pre-trained embeddings. Should I fine-tune?
    - Lots of data: yes
    - Just a small dataset: no
- Analysis (e.g. bias, semantic change)
  - Train embeddings from scratch

# Agenda

- ~~What are word embeddings?~~
- ~~How do we learn word embeddings?~~
- Properties of word embeddings
- Evaluation
- Biases in word embeddings
- Application: analyzing semantic change

# Properties of word embeddings

# Relationships between words

## Synonyms

- *couch / sofa*
- *big / large*
- *bike / bicycle*

## Antonyms

- *hot / cold*
- *long / short*
- *good / bad*

# Properties of word embeddings

Figure: company - ceo

Figure: comparative - superlative

Source: <https://nlp.stanford.edu/projects/glove/>

# Properties of word embeddings: analogies

We can look at analogies in the vector space, for example:

*king - man + woman  $\approx$  queen*

**Figure:** Figure 2 from Linguistic Regularities in Continuous Space Word Representations, Mikolov et al. NAACL 2013 [\[url\]](#)

# Properties of word embeddings: analogies

We can look at analogies in the vector space, for example:

*king - man + woman  $\approx$  queen*

$$\text{king} - \text{man} = [4,2] - [1,6] = [3,-4]$$

$$\text{king} - \text{man} + \text{woman} = [3,-4] + [4,8] = [7,4]$$

# Stability of embeddings

Many factors can have an effect on the training (corpus size, presence/absence of documents, etc...). How *stable* are embeddings?

**Measures of stability:** One simple method is looking at the overlap between nearest neighbors in an embedding space

Figure: *word2vec* embeddings: lower frequency words have lower stability and higher frequency words have higher stability (Figure 1 from Wendlandt et al. 2018)

# Stability of embeddings

Antoniak and Mimno et al. 2018:

- The training corpus is only a sample!
- But: they were sensitive to the presence of specific documents
- *“with smaller corpora comes greater variability, and we recommend that practitioners use bootstrap sampling to generate an ensemble of word embeddings for each sub-corpus and present both the mean and variability of any summary statistics”*

Evaluating the Stability of Embedding-based Word Similarities, Antoniak and Mimno, TACL 2018 [\[url\]](#)

**recap!**

## Design decision: context

**The distributional hypothesis:** Words that occur in similar **contexts** tend to have similar meanings.

**recap!**

## Design decision: context

**The distributional hypothesis:** Words that occur in similar **contexts** tend to have similar meanings.

How do we define our **context**?

# Context

Australian scientist discovers star with telescope

context window = 1

# Context

Australian scientist discovers star with telescope

context window = 2

# Context

Australian scientist discovers star with telescope

context window = sentence

# Context

Australian scientist discovers star with telescope

context window = sentence

Smaller contexts → syntactic properties

Large contexts → semantic/topical properties

Example Levy and Golbert, ACL 2014 for *hogwarts*:

window=2: *evernight* and *sunnydale* vs. window=5: *dumbledore*, *hallows*

(Levy and Golbert, ACL 2014; Melamud, NAACL 2016; and others)

# Intrinsic evaluation

- Similarity
- Analogies
- Clustering
- Coherence
- Probing classifiers

This method is referred to by Levy and Goldberg (2014) as **3COSADD**

$\mathbf{a} - \mathbf{a}^* \approx \mathbf{b} - \mathbf{b}^*$ .  $\mathbf{b}^*$  can be found as follows:

$$\operatorname{argmax}_{\mathbf{b}^* \in V} \cos(\mathbf{b}^*, \mathbf{b} - \mathbf{a} + \mathbf{a}^*)$$

# Intrinsic evaluation

- Similarity
- Analogies
- Clustering
- Coherence
- Probing classifiers

This method is referred to by Levy and Goldberg (2014) as **3COSADD**

$\mathbf{a} - \mathbf{a}^* \approx \mathbf{b} - \mathbf{b}^*$ .  $\mathbf{b}^*$  can be found as follows:

$$\operatorname{argmax}_{\mathbf{b}^* \in V} \cos(\mathbf{b}^*, \mathbf{b} - \mathbf{a} + \mathbf{a}^*)$$

Linzen 2016 notes that results can be misleading: The offsets are often very small, so that often just the nearest neighbor to  $\mathbf{b}$  is returned.

Control setting: Just return the nearest neighbor of  $\mathbf{b}$

Issues in evaluating semantic spaces using word analogies, Tal Linzen.

# Biases reflected in analogy tasks

Biases reflected in analogy tasks:

*man* is to *computer programmer* as *woman* is to ? :  $x = \text{homemaker}$   
*father* is to *doctor* as *mother* is to ? :  $x = \text{nurse}$

Note: Input words are excluded as possible answers! (see also [Nissim et al. 2020 \[url\]](#))

Compare: gender-specific words (e.g., *brother*, *businesswoman*) vs. *gender-neutral* words (e.g. *nurse*, *teacher*).

Man is to Computer Programmer as Woman is to Homemaker? Debiasing Word Embeddings, Bolukbasi, et al. NIPS 2016 [\[url\]](#)

# Biases in word embeddings

Find gender analogies. We want to find pairs that are parallel to the seed direction and its words should be close to each other.

$$S_{(a,b)}(x,y) = \cos(a - b, x - y) \quad \text{if} \quad \|x - y\|_2 \leq \delta$$

$\text{embedding}_{she}$        $\text{embedding}_{he}$        $L_2 \text{ distance}$

---

## Gender appropriate she-he analogies

---

queen–king  
sister–brother  
ovarian cancer–prostate cancer  
mother–father  
convent–monastery

---

---

## Gender stereotype she-he analogies

---

nurse–surgeon  
sassy–snappy  
cupcakes–pizzas  
lovely–brilliant  
vocalist–guitarist

---

Bolukbasi et al. look at 300-dimensional embeddings from w2vec Google news corpus.

Dong Nguyen (2021)

# Word-Embedding Association Test

- The Implicit Association Test (IAT) is based on response times and has been widely used.

Semantics derived automatically from language corpora contain human-like biases, Caliskan, Bryson, Narayanan, Science 2017 [\[url\]](#)

# Word-Embedding Association Test

- The Implicit Association Test (IAT) is based on response times and has been widely used.
- Word-Embedding Association Test (WEAT) by Caliskan et al: use the cosine similarity between pairs of vectors as analogous to reaction time in the IAT

Were able to replicate  
well-known IAT  
findings!

Semantics derived automatically from language corpora contain human-like biases, Caliskan, Bryson, Narayanan, Science 2017 [\[url\]](#)

# Word-Embedding Association Test

Let  $X$  and  $Y$  be two sets of **target words** of equal size;

Let  $A$ ,  $B$  be the two sets of **attribute words**.

For a given target word  $w$  we get a score:

$$s(w, A, B) = \text{mean}_{a \in A} \cos(\vec{w}, \vec{a}) - \text{mean}_{b \in B} \cos(\vec{w}, \vec{b})$$

*Target words  $X$ —flowers:* aster, clover, hyacinth, crocus, rose, ...

*Target words  $Y$ —insects:* ant, caterpillar, flea, spider, bedbug, ...

*Attribute words  $A$ —pleasant:* freedom, love, peace, cheer, ...

*Attribute words  $B$ —unpleasant:* abuse, crash, filth, murder, divorce,...

Semantics derived automatically from language corpora contain human-like biases, Caliskan, Bryson, Narayanan, Science 2017 [\[url\]](#)

# Word-Embedding Association Test

Let X and Y be two sets of **target words** of equal size;

Let A, B be the two sets of **attribute words**.

For a given target word  $w$  we get a score:

$$s(w, A, B) = \text{mean}_{a \in A} \cos(\vec{w}, \vec{a}) - \text{mean}_{b \in B} \cos(\vec{w}, \vec{b})$$

*Target words X—math:* math, algebra, numbers, calculus, ...

*Target words Y—arts:* poetry, art, dance, literature, ...

*Attribute words A—male:* male, man, boy, brother, he, him, ...

*Attribute words B—female:* female, woman, girl, sister, she, her,...

Semantics derived automatically from language corpora contain human-like biases, Caliskan, Bryson, Narayanan, Science 2017 [\[url\]](#)

# Word-Embedding Association Test

**Fig. 1. Occupation-gender association.** Pearson's correlation coefficient  $\rho = 0.90$  with  $P < 10^{-18}$ .

# Perpetuation of bias in sentiment analysis

*“I had tried building an algorithm for sentiment analysis based on word embeddings [..]. When I applied it to restaurant reviews, I found it was ranking Mexican restaurants lower. The reason was not reflected in the star ratings or actual text of the reviews. It’s not that people don’t like Mexican food. **The reason was that the system had learned the word “Mexican” from reading the Web.**”*

# Agenda

- What are word embeddings?
- How do we learn word embeddings?
- Properties of word embeddings
- Evaluation
- Biases in word embeddings
- Application: analyzing semantic change

Application:  
analysis of semantic change

# Applications: Semantic change

Figure 1. from Diachronic Word Embeddings Reveal Statistical Laws of Semantic Change, Hamilton et al., ACL 2016 [\[url\]](#)

# Tracking change in embedding space

period 1

period 2
